

Yes you can ! Recover now from hepatitis C !

Version anglais

Hepatitis C is a virus that attacks your liver. The liver is a vital organ for our body. If it's sick, it can't function properly.

Often, you experience few or no symptoms. If not treated quickly, this disease can have serious consequences for your health.

Hepatitis C is transmitted by blood-to-blood contact. For the virus to pass from one body to another, there must be an "entry point" in the body (a needle injection site, a sexual organ, etc.), via the blood.

To avoid contamination, do not use other people's equipment (for hygiene, tattooing, drug use, etc.) and avoid unprotected sex.

To protect yourself, use your own or new equipment and condoms during sexual relations (especially anal).

On the other hand, you can live with or kiss someone, shake hands or share a glass of water or food without risk.

Yes you can ! Recover now from hepatitis C !

Version anglais

To find out if you're ill, you need to be tested. This is done by taking a blood sample. The blood test will tell us if you have ever been in contact with the virus.

If this is the case, you will need to undergo further tests to find out if you are currently ill. These tests are not very painful.

Today, there is a highly effective treatment with few side effects, in tablet form, to be taken every day for 2 to 3 months. Take all the tablets and at the same time every day to increase your chances of recovery.

You can take the treatment even if you take drugs or alcohol.

Once cured, it is possible to be recontaminated. So protect yourself and ask a doctor or nurse for regular screening.
